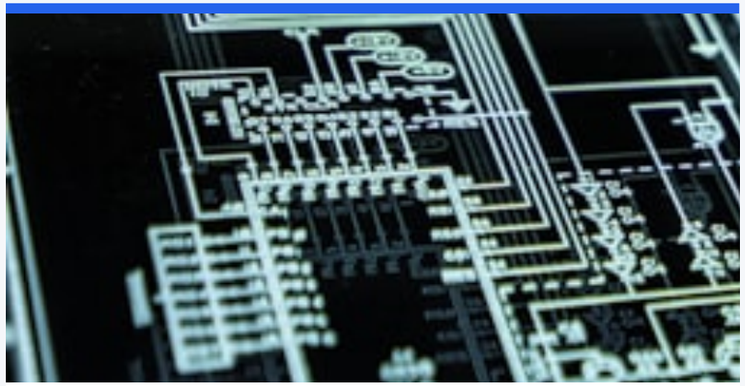
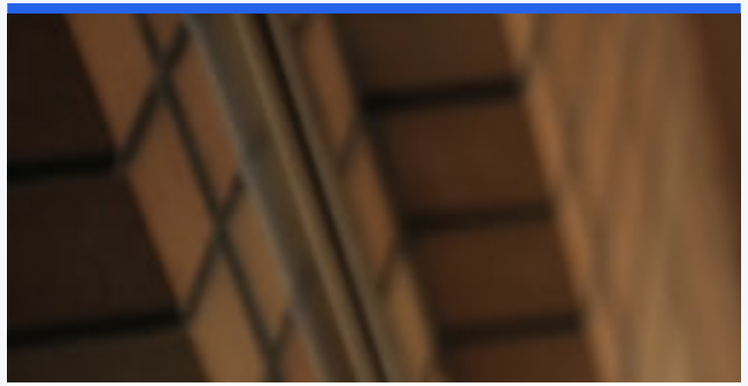
Future of AI: Emerging Technologies



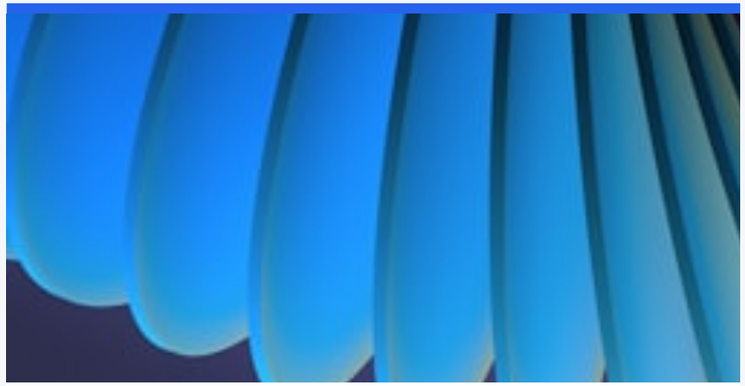
RAG (Retrieval-Augmented)

Combines retrieval and generation models to access external knowledge sources. This allows AI to provide accurate, contextually relevant responses by leveraging up-to-date databases for complex queries.



Autonomous AI Agents

Entities designed to perform tasks and make decisions without human intervention. From robotics to virtual assistants, agents perceive their environment to achieve specific goals autonomously.



Multi-modal AI

Systems that process multiple data types simultaneously, including text, images, and audio. This integration enables comprehensive analysis for applications like medical diagnostics and media understanding.
